

Strike Balance Between Representation and Excessive Complexity:

Marketing:

- At most five choices with intentions, excessive options could overwhelm and cause confusion or completion rates.
- Few options could miss out on important information
- Demographic data for customer segmentation to build profiles

Broader Themes:

- Categories to sort sentiments giving people the illusion with more choices.

Text Mappings:

- Narrow down excessive options into smaller categories

Data Collection:

- Targeted ads should only collect data that is necessary to promote better options

Objective Scale:

- Plenty of research goes into hedonic scale, but other subjects could be more sensitive to be categorized. It is difficult to put certain groups on a scale.
- Difficult to find optimal scale, while balancing difficulty to run statistical inference on it
- Open textbox to be inclusive?

Question to Ask:

- How was the survey distributed?
- Be mindful of asserting stereotypes during binarization of categorical features

Conversation of ethics about data collections:

- Lay out negative effects or gaps of survey research study
- Look at similar studies and their outcomes to help shape current research
